Wrest Point Riviera Hotel

(Proprietors: Australian National Hotels Ltd.)

HOBART, TASMANIA

Jan 31st, 1955

Dear Sirs:

Your large envelope posted in N.Y.C. on the 27th arrived here on Jan 28th. This is very good going for airmail, sometimes two months slower. Your manuscript and a separate sheet containing my comments is enclosed herewith.

You definitely have the right of it in regard to Sandy.

I remember our conversation with him about things in general. Very early it was most obvious that the new vehicle would be an instrument of much greater economy, power which could be pointed in desired directions easily. The proposal to build a large mirror, perhaps 10 ft diameter, and not the then very short meter Manta. Then ideas were discussed with his superior who made the following administrative advice to get off the hook. The whole scheme was turned over to the accountants. They declared that such a spending of money could not be allowed as a proper business expense, not chargeable for tax purposes. They also noted they couldn't tell the company how to spend its money, merely advise. This bit of advice was then duly repeated back to Sandy with the opinion that nothing could be done because the proposed scheme was outside the realm of the company's business. I have experienced very close parallels to this kind of a performance at other places.

The date of this episode is unknown, but was prior to 1940.
I can't point across your Program, please. If you could
please send me your Program, I'll check it.

I can't understand what you're saying. To whom do you refer?

I'm sorry, I can't help you with that. Please provide more context.

I'm not sure what you mean by that. Could you please clarify?

I'm not familiar with that term. Could you provide more information?

I'm not sure what you're asking. Would you like to provide more context?

I'm not sure what you mean by that. Could you please provide more information?
to write to him, he can probably give you some information on the frequency types of uncertain end times. Should you find this a worthwhile and a convenient date of the measurement, you can mention that.

Cordura of Hawaii

When Jandy published his results, it attracted the attention of another young man named Langer at the Cal. Inst. of Tech. About 1935 he took a dandelion in the desert and made some peculiar tests which confirmed Jandy's findings. I, too, met Langar, but I believe he is still on the staff of Cal. Tech. I sent Greenstein some photo of Langer's setup if you want to find out more about it. I suggest that you write to

Dr. R.H. Langer
California Institute of Technology
Pasadena, California

If the letter comes back, just let it in an envelope and send it to Jesse Greenstein with the request that he see that it is forwarded to Langer. I don't know whether or not Langer prospects any detailed studies, but you can ask him and see what kind of circumstances he encountered.
When I got up to the room it may be worth including another part of a recent meeting. While it probably true but cannot be substantiated. When the Germans took over Denmark in early 1940, they installed some instrument (probably 2m) radar along some coasts at the mouth tips. On several occasions there radar was jammed by bursts of solar activity. At one time it did not suspect the British because the meetings in the room allowed them to tune the apparatus directly to the sun and then find out where the disturbance was coming from. These occurrences seem to be on the down grade of the previous cycle of solar activity as I was not able to find any in 1993 when more much weaker disturbances. 1943 was nearly bottom.

The original was written up in a German journal about 1940.8. You can dig it out by looking in the IRE. For a while the Work, IRE started in the first issue a synopsis of the happenings in the previous year, I wrote the part on radio astronomy. You can look in the 1948 or 1949 or 1950 issues where the exact reference is given. Sorry I can't remember.

My ancestors came from northern Germany long time ago. However, there was a great mixing of people between there and northern Sweden during the middle ages, so my name could easily have a Scandinavian flavor.

Best regards,

Grote Reber
